An invention by a University of Houston engineer that turns your smartphone into a microscope, allowing it to
detect whether your pond water is healthy, is getting attention in the media. Houston’s CBS affiliate, KHOU-TV
Channel 11 aired a story about the invention of the DotLens, which came to life in the laboratory of electrical and
computer engineering Associate Professor Wei-Chuan Shih.

Much like the invention of the Post-it note, which occurred by happy accident when a chemist failed to invent a
strong adhesive and instead invented the weaker one that would peel from paper, the DotLens came about
through a friendly lab mishap.

Learn more about it and watch the Ch.11 story [here](https://www.ch11tv.com/news/local/news-dotsconverge-into-smartphone-microscope-for-one-summer).
